

Legwork

Get paid for the legwork.

Paid, verified, real-world missions for Seeker owners. Funded in USDC, settled on Solana, proven with the phone in your pocket.

CLOCK IN · Solana Mobile hackathon · October 2026

Marc Donovan · github.com/Marc-Dvci/Legwork

Real-world facts go stale when nobody is looking

Does that café still accept USDC? Is the charger working? Is our poster still up? Someone has to go and look.

Merchants and directories

Payment methods, opening hours and stock change weekly. A wrong listing costs a customer every time.

Infrastructure operators

Chargers, kiosks and signage fail in the field long before a ticket is raised.

Events and communities

Posters, booths and pop-ups exist for days. Verification by staff costs more than the campaign.

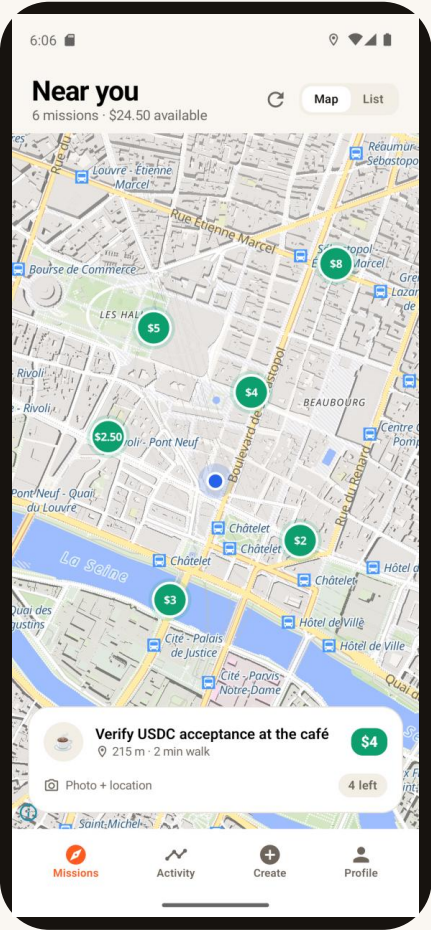

The Solana ecosystem

"Where can I actually pay with USDC?" is still answered by hearsay.

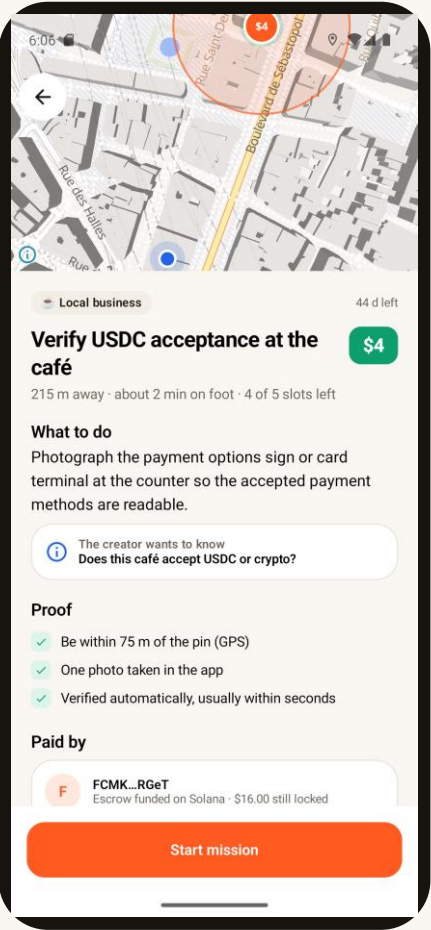

Today the options are an employee's afternoon, a contractor, a phone call nobody answers, or a gig platform with a 30% take and no proof.

Seeker owners become a paid verification network

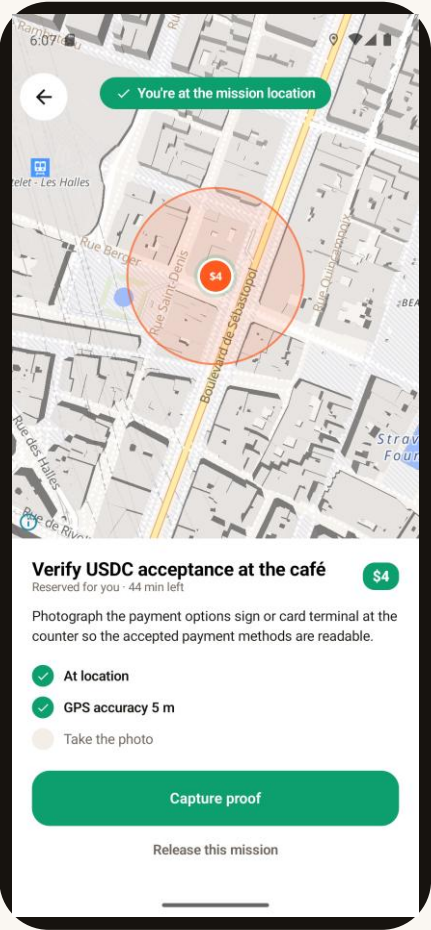

A creator funds a mission in USDC. A nearby worker walks there, proves it with GPS and the camera, and is paid from escrow in seconds.

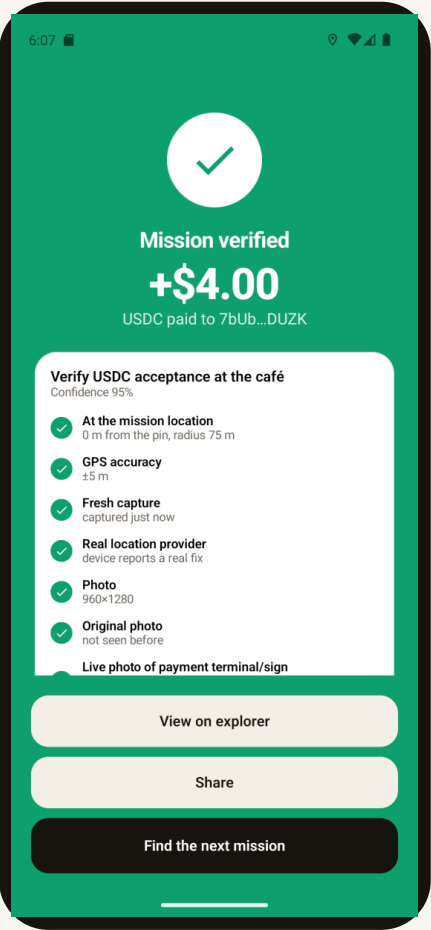

Missions near you, priced

GPS confirms arrival

Verified and paid

One loop, six steps, every one of them on the phone

1 Discover

Reward pins on a live map. Alerts when a mission lands within your radius.

2 Reserve

A slot is held for 45 minutes on chain. Gasless for the worker.

3 Walk

Live distance, navigate intent, and a green state the moment you are inside the radius.

4 Prove

In-app camera only. The photo carries GPS, accuracy, timestamp and device signals.

5 Verify

Location policy, freshness, duplicate detection, then a vision judge with named checks.

6 Get paid

approve_completion moves USDC from the vault to your wallet and writes the proof hash.

Score, streak and earnings update from chain, and the map already shows the next one.

Remove the phone and the product stops working

Legwork is not a web app in a wrapper. The phone is part of the protocol.

GPS is the first proof

Presence inside the mission radius, accuracy-aware, mock providers rejected.

The camera is the second

Live capture only. No gallery uploads. Perceptual hashes catch re-used photos.

The Seeker is the third

The Seeker Genesis Token binds one device to one worker for Seeker-only missions.

Notifications bring people back

"\$8 mission 400 m away", computed on the device every 15 minutes from the last position.

Movement is the mechanic

Distance counts down live; arrival flips the screen green and unlocks the shutter.

Checklist on the capture screen

The chain is the database

Missions, escrow, reservations, completions, reputation, streaks and stake are accounts of one Anchor program. The verifier holds no state.

Mission + vault

A PDA per mission with its own USDC token account. The creator funds reward × slots in one signature.

Reservation

Held for a worker by the verifier's signature. The worker never pays a fee.

Completion

Proof hash, confidence and the yes/no answer, written in the same transaction as the payout.

WorkerProfile

Approved, rejected, streak, score, categories, SKR stake, Seeker binding. Readable by any client.

Escrow you can inspect

"\$12.00 still locked" on the mission page is the vault balance.

Instant global settlement

A worker in Paris is paid by a creator anywhere, in seconds, with a transaction link.

Permissionless reads

Leaderboards and creator analytics are getProgramAccounts calls.

Verifier is a key, not a database

It can only pay a reserved worker from that mission's vault, once.

Seeker hardware gets real marketplace utility

Seeker verified badge

The app inspects the wallet's Token-2022 accounts for a Seeker Genesis Token (mint authority, metadata pointer, token group), then the verifier binds it on chain.

One device, one worker

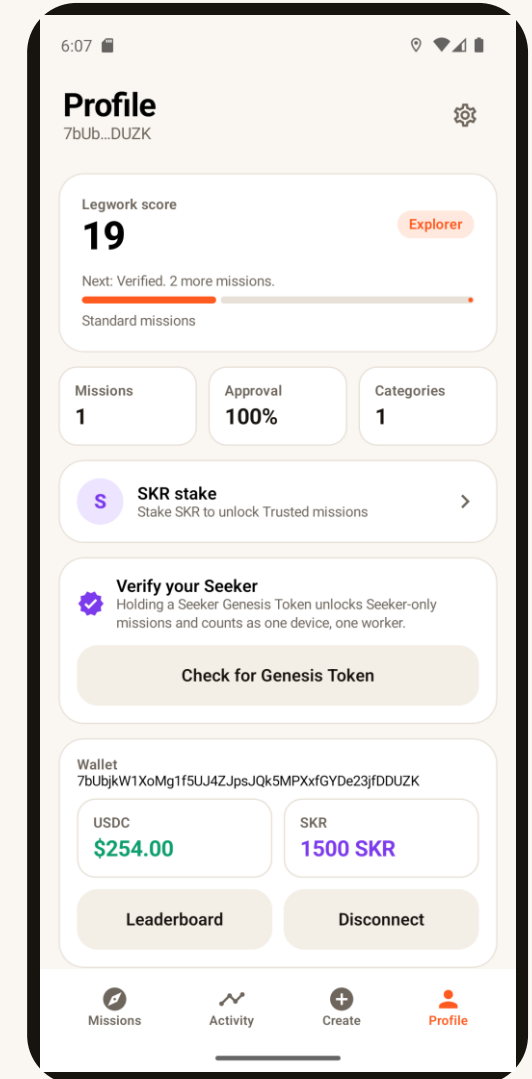

A Device PDA maps each Genesis Token mint to a single wallet. Sponsored campaigns can pay once per Seeker, not once per keypair.

Seeker-only missions

Creators tick "Seeker only"; the program refuses approvals from unbound wallets. Ecosystem campaigns land in Seeker owners' pockets first.

Verified tier from day one

A bound Seeker skips the Explorer tier: priority verification and a badge on the leaderboard.

Profile: tier, stake, Seeker check

SKR is the commitment behind trust

Remove SKR and the marketplace loses its trust tiers and its fee schedule. Staking is enforced by the program, not by a spreadsheet.

Explorer	Standard missions	0 missions
Verified	Badge, priority verification	3 missions or a Seeker
Trusted	Higher-value missions, two reservations	10 missions + 100 SKR
Expert	Premium campaigns, dispute reviewer	40 missions + 1000 SKR

Creators stake 500 SKR

Platform fee drops from 10% to 5% on every mission they fund. Computed on chain at funding time.

Workers stake to climb

Stake is locked in a config-owned vault and can be withdrawn at any time. Creators can require a minimum score.

Mainnet SKR mint SKRbvo6Gf7GondiT3BbTfuRDPqLWei4j2Qy2NPGZhW3 · a test mint stands in on devnet

Creators deploy people in one signature

Templates

USDC acceptance, charger check, poster check, shelf availability, opening hours.

Pin on the map, set the radius

Reward, number of completions, deadline, Seeker-only, minimum score.

Fund and publish

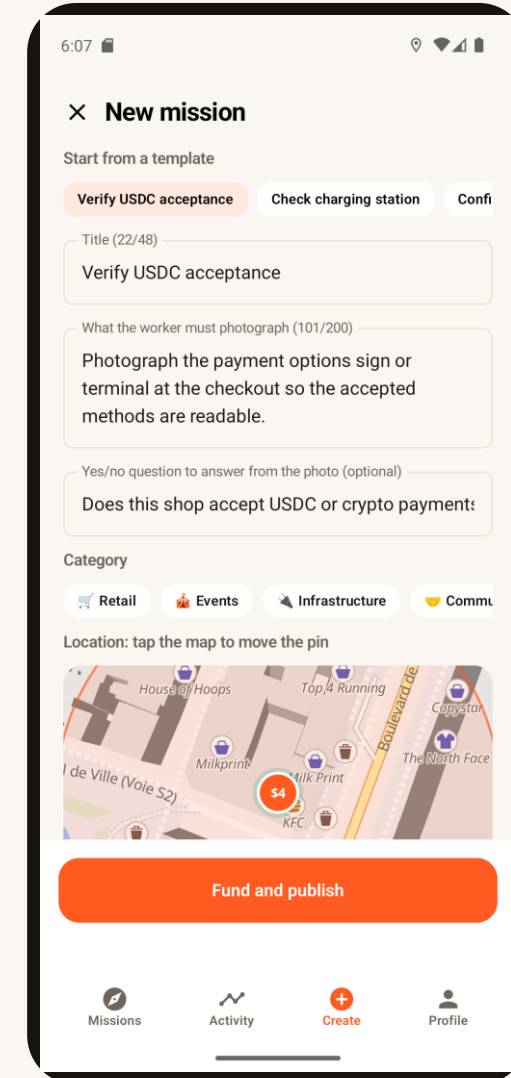

One wallet signature creates the mission, its vault, the escrow and the fee.

Answers, not just photos

A yes/no question is answered on chain per completion; the dashboard tallies Yes / No / Unclear.

Close and recover

Whatever is not claimed comes back to the creator's wallet.

New mission with funding summary

Every proof passes named checks the worker can see

✓	At the mission location	$\text{distance} \leq \text{radius} + \min(\text{accuracy}, 50 \text{ m}) + 25 \text{ m}$
✓	GPS accuracy	$\leq 100 \text{ m}$, mock-location flag rejected
✓	Fresh capture	timestamp within 10 min of server time
✓	Original photo	SHA-256 not on chain, dhash Hamming > 6 from recent
✓	Live photo, not a screen	vision judge flags re-photographed screens and prints
✓	Photo matches the mission	relevant, fulfils the instructions, confidence ≥ 60
✓	2 to 4 mission-specific checks	e.g. "accepted payment methods are readable"

Privacy by construction

Photos are judged in memory and discarded. Only the hash goes on chain. Precise location is read only while a mission screen is open.

Keys stay in the wallet

Sign-in, funding and staking go through Mobile Wallet Adapter. The verifier key can only pay a reserved worker from that mission's vault.

A marketplace fee, paid at funding time, on chain

10%

platform fee on funded rewards

5%

for creators staking 500 SKR

\$0

for workers: reservations and payouts are gasless

Worker reward \$5 · creator pays \$5.50 · Legwork treasury receives \$0.50, in the same transaction that funds the escrow.

Commerce intelligence

Payment methods, shelf checks, price and opening-hour verification for directories and brands.

Infrastructure

Chargers, kiosks, signage and accessibility checks for operators and cities.

Events

Poster presence, booth check-ins, conference scavenger missions.

Solana ecosystem

"Pay with USDC here" merchant maps, Seeker-only campaigns, community verification drives.
